

A demo to run on cc-lyon:

source setup.sh

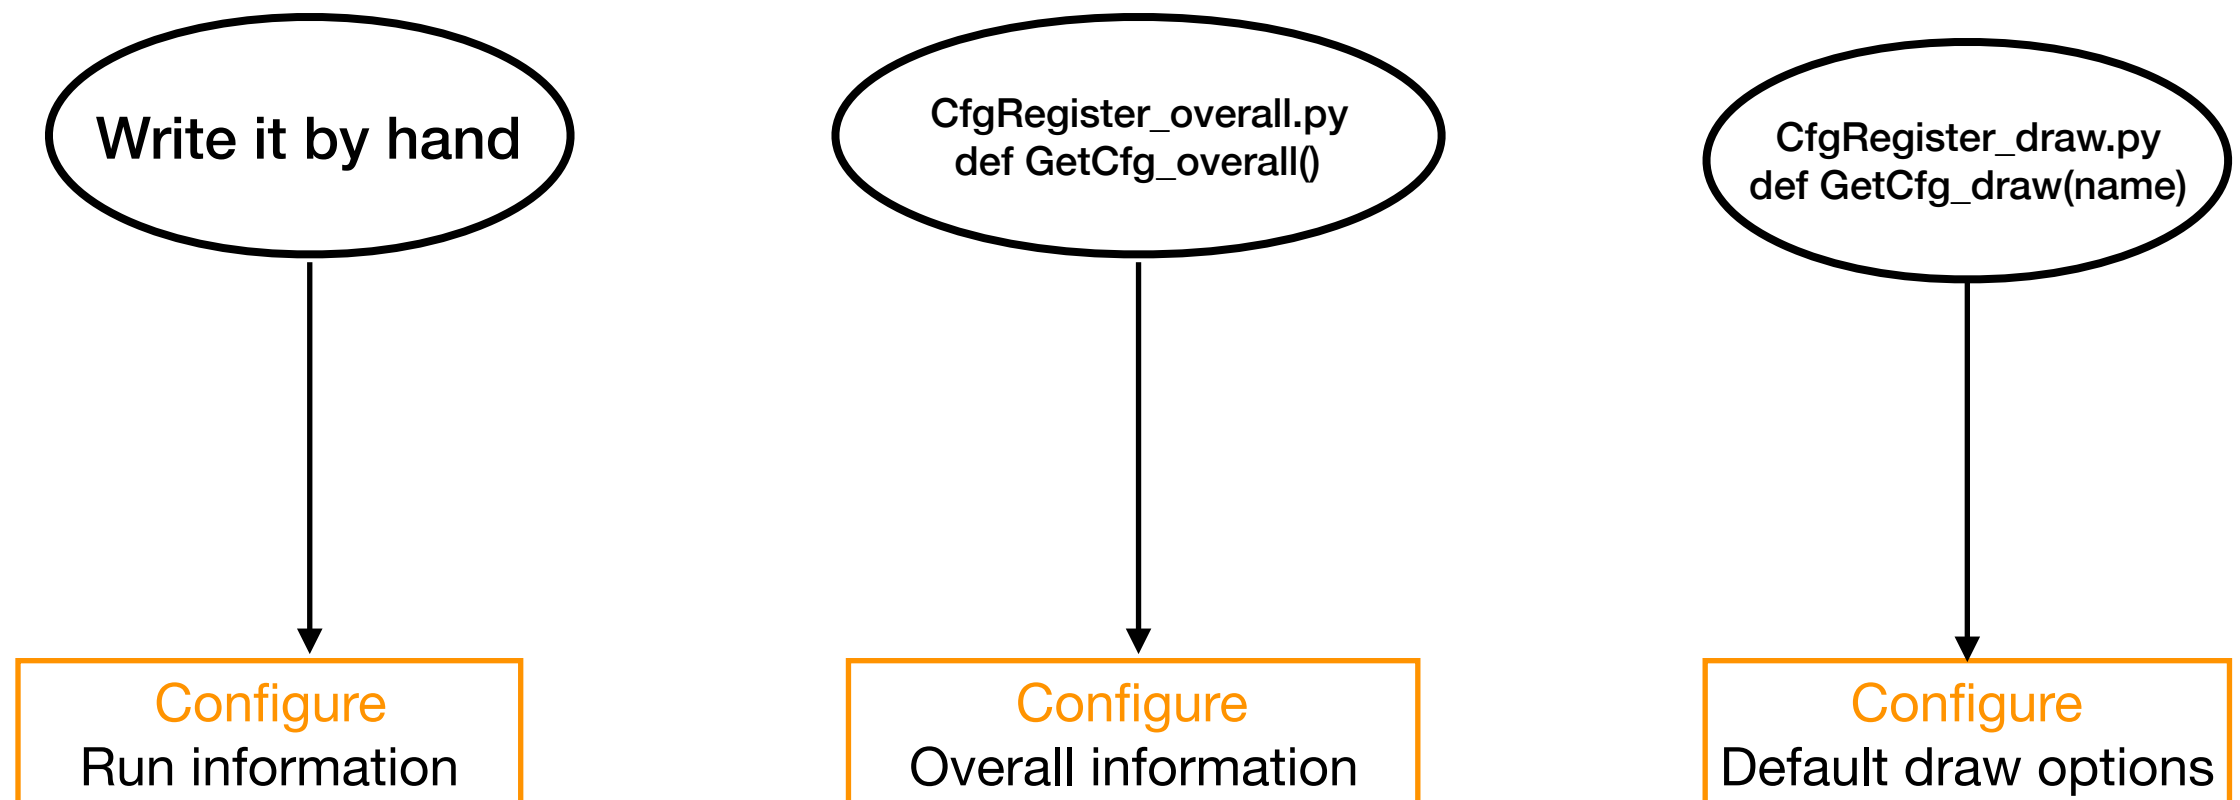

python scripts/run_demo.py

How it works

When you have a new input root file:

1. Check if all the configure files are correct
2. otherwise, update/regenerate them with dedicated scripts or write by hand

When you have a new input root file:

1. Check if all the configure files are correct, otherwise update/regenerate it with dedicated scripts
2. Get the btagging json files and control plot
3. Get the SF/Eff/SFcomparison plots and breakdown tables
